 - 3 Confirm your selection on the next screen.
 - 4 Wait until the new partitions are created and the notebook reboots.

Performing an application recovery

The application recovery utility allows you to reinstall individual applications. Reinstalling a program can fix the problems encountered if it does not correctly run anymore.

To perform an application recovery, proceed as follows:

- 1 Take the **last** product recovery CD-ROM.
- 2 Turn on your computer (using AC power only) and wait until Windows has booted up.
- 3 Insert the product recovery CD-ROM into the DVD-ROM drive.
- 4 Open the drive through **My Computer** and click the **Apps** directory.
- 5 Open the directory that corresponds to the application you want to recover.
- 6 Double-click the **Setup** program.
- 7 Follow the instructions in the **Installer**.

 You must run the last product recovery CD-ROM from Windows.

The application will not run from DOS.

When performing an application recovery, you do not lose data on your hard disk.

In most cases, it is advised to uninstall an application before reinstalling it.

Reinstalling a device driver

Some applications or peripherals require specific drivers which you will not find in the Windows® **Driver Cache** folder. To help you find or restore typical drivers needed by your pre-installed applications, you can use the last product recovery CD-ROM.

To reinstall a device driver, proceed as follows:

- 1 First check whether the driver you want to reinstall is on the **last** product recovery CD-ROM. Only device drivers that are not delivered with Windows® can be found in the **Drivers** folder.

- 2 Check all underlying sub-directories for the appropriate driver.
- 3 Next, launch the **Add Hardware** Wizard (click **Start, Control Panel**, and then double-click **Add Hardware** to install the appropriate device).

If you do not immediately see the **Add Hardware** icon, click **Switch to Classic View** on the left side.

If a more recent driver is already installed, a warning message appears which you can ignore.

Using partitioned drives

In **My Computer**, you may have noticed the availability of two drives (C: and D:). Your hard disk drive comes from the factory with 2 logical partitions: this does not mean that your computer contains two physical hard disks.

When you start using your notebook, your C: drive contains all the files required by Windows and other pre-installed software, while the D: drive is empty. The D: drive is the ideal storage space for all your documents and files, especially big ones like digital motion pictures captured by DVgate.

 Although you can perform a system recovery and change the partition settings in order to have one C: drive only, this option is not recommended for using video editing applications like DVgate.

To optimize data storage, use the C: drive to install new applications, and save all your documents and files to the D: drive. Moreover, doing so will prevent the loss of your data in the case you need to perform a system recovery.

Do not try to add, delete, or resize partitions unless you really need to. Changing partition settings might delete all your files on the hard disk.

If you need to perform a system recovery, but do not want to lose all the data stored on your hard disk, copy all the files you want to keep on the D: drive. During the system recovery process, choose to keep the current partition information. Doing so will keep your D: drive unchanged after the recovery process.

If you do need to change the size of your partitions, you can do so by performing a system recovery. In this case, it is important to be aware that all data on your hard disk will be deleted. If you need to keep existing files, be sure to back them up before performing the system recovery.
